Introduction

- ▶ The aim of this study is to differentiate children with *autism spectrum disorder* (ASD) from *normal children*, in terms of their speech production features.
- ▶ ASD is a neurodevelopmental disorder which involves communication deficits, social interaction impairments, and hyperfocus or reduced behavioral flexibility [1]*.
- ▶ The verbal ASD children often shows some notable acoustic patterns.
- ▶ 1 in 110 children is diagnosed with ASD [2]†.

Why this study is important?

- ▶ In our collected datasets all the speakers are non-native (Indian accent) English speakers. Whereas, in the earlier studies like [3], [4], etc., authors have only considered the native English speakers.
- ▶ In previous studies datasets were mostly collected from social interactions [2].
- ▶ Many robust speech features, especially dominant frequencies (FD1, FD2) [5], strength of excitation (SoE) [6, 7], etc., have not been explored in previous studies.
- ▶ Results of this study can be utilized as acoustic markers for ASD diagnosis.

Speech Production Features

Types of production features used for the classification are:

1. Source Features

- ▶ fundamental frequency (F0) [6]
- ▶ strength of excitation (SoE) [6, 7]

2. Vocal tract filter features

- ▶ dominant frequencies (FD1, FD2) [5]
- ▶ first five formants (F1 to F5) [10]

3. Source-system combined features

- ▶ signal energy (E) [11]
- ▶ zero-crossing rate (ZCR) [12]
- ▶ mel-frequency cepstral coefficients (MFCC) [13]
- ▶ linear prediction cepstrum coefficients (LPCC) [13]

Classifier's Design

Six different classifiers are utilized in this study:

- ▶ support vector machine (SVM) [14]
- ▶ k-nearest neighbors (KNN) [15]
- ▶ linear discriminant (LD) [16]
- ▶ quadratic discriminant (QD) [17]
- ▶ decision tree (DT) [18]
- ▶ logistic regression (LR) [19]

Results (cont.)

Results of statistical analyses

A few key observations are (*Details results are given in the paper*):

- ▶ The ASD children have **higher μ_{F0} , μ_E , and μ_{ZCR} values** than the normal children.
- ▶ The ASD children have **lower μ_{SoE} value** than the normal children.
- ▶ VT filter features **μ_{F2} , μ_{F3} , μ_{F4} , and μ_{F5} , have higher values** for ASD children than the normal children.
- ▶ But **μ_{F1} has lower value** for ASD children than the normal children.
- ▶ The **μ_{FD1} have higher value** and **μ_{FD2} have lower value** for the ASD children as compared with the normal children.

Conclusion

- ▶ It is observed that there are significant differences between the Indian ASD and the normal children, in terms of their speech production characteristics.
- ▶ The results obtained in this work can be utilized as an acoustic biomarker to identify ASD from the speech signal at a very early age.
- ▶ These robust results obtained from Indo English children with ASD can be compared with native English children with ASD, in future studies.
- ▶ A small size of speech data especially for female ASD children is a limitation of this research work.
